7	Objects [seem to] travel too fast at large distances from centre (1) Either :	
	As orbital speed $\propto \sqrt{m}$ (<i>m</i> = enclosed mass) [accept <i>v</i> increases as <i>m</i> increases] (1) this suggests that the galaxy has extra [or hidden] mass (1).	
	Extra mass related to dark matter.	
	Far from centre, the mass within the orbit should be ~ constant (1)	
	so orbital speed v should be $\propto \frac{1}{\sqrt{r}}$ (theoretical) (1)	
	So enclosed mass $\propto \sqrt{r}$ for constant $v(1)$	
	Alt: Observed speeds too large [for objects to remain in galaxy] (1) so equation shows <i>M</i> is 'too large' (1) Speed doesn't fall off [at large distance] as theory suggests so mass	
	Extra mass attributed to dark matter (1)	4
